LANGUAGES & FRAMEWORKS

- Python
- SQL
- Bash
- JSON
- YAML
- XML

APIs & PROTOCOLS

- REST APIs
- HTTP/HTTPS
- OAuth 2.0
- JWT
- WebSockets

TOOLS & PLATFORMS

- Git
- Linux
- Nginx
- Redis
- AWS (EC2/S3)
- Postman
- Jenkins

DATABASES

- PostgreSQL
- SQLite
- MySQL

PRACTICES

- Agile/Scrum
- CI/CD
- Code Review
- Unit Testing
- Documentation

EDUCATION

B.S. Computer Science
University of Washington
2018

PROFESSIONAL SUMMARY

Backend developer with 5+ years of experience building scalable REST APIs and data pipelines using Python and SQL. Experienced with Linux server administration, cloud infrastructure, and delivering clean, well-documented code in Agile teams.

EXPERIENCE

Senior Backend Developer | DataStream Technologies

Jan 2021 – Present | Seattle, WA

- Designed and maintained a suite of Python-based REST APIs handling over 120,000 daily requests, reducing average response time by 34% through query optimization and Redis caching strategies.
- Built automated ETL pipelines in Python processing 2TB of structured JSON data weekly from third-party vendor APIs, collaborating closely with the data engineering team.
- Maintained and tuned SQL database schemas across 6 production databases, writing complex multi-table JOIN queries and stored procedures for business intelligence reporting.
- Led migration of legacy Bash scripts to modular Python services, reducing deployment time by 50% and eliminating 3 critical failure points in the data pipeline.
- Mentored two junior developers on REST API design principles, Git branching strategies, and Linux server management best practices.
- Integrated OAuth 2.0 and JWT-based authentication into existing API infrastructure, improving security posture across all internal services.

Backend Developer | Northgate Software

May 2018 – Dec 2020 | Bellevue, WA

- Built Python microservices for a SaaS platform serving 400+ enterprise clients, implementing rate limiting, pagination, and versioned REST API endpoints.
- Wrote SQL queries and data migration scripts to transition 15 million records from a legacy Oracle system to a new PostgreSQL-based architecture.
- Automated Linux server monitoring using Bash scripts and cron jobs, reducing manual operations work by 8 hours per week.
- Developed an internal JSON-based configuration management system used across 12 production services.
- Participated in on-call rotation, diagnosing and resolving Linux server issues and API failures with an average resolution time under 45 minutes.
